$$\textcircled{b} \int_{C_2} \vec{F} \cdot d\vec{r} = \int_0^1 \vec{F} \cdot \frac{d\vec{r}}{dt} dt = \int_0^1 \langle tt^2, t^2t^4, tt^4 \rangle \cdot \langle 1, 2t, 4t^3 \rangle dt$$

$$= \int_0^1 \langle t^3, t^6, t^5 \rangle \cdot \langle 1, 2t, 4t^3 \rangle dt$$

$$= \int_0^1 (t^3 + 2t^7 + 4t^8) dt = \int_0^1 (t^3 + 2t^7 + 4t^8) dt$$

$$= \left[\frac{t^4}{4} + \frac{t^8}{4} + \frac{4t^9}{9} \right] = \frac{1}{4} + \frac{1}{4} + \frac{4}{9} = \frac{1}{2} + \frac{4}{9} = \frac{9}{18} + \frac{8}{18} = \boxed{\frac{17}{18}}$$

$$\textcircled{14} \quad \vec{r}(t) = \langle t, t^2 \rangle, \quad 1 \leq t \leq 2$$

$$\int_C \frac{x}{y} dy = \int_1^2 \frac{t}{t^2} 2t dt = \int_1^2 2 dt = \left[2t \right]_1^2 = 4 - 2 = \boxed{2}$$

16.2

$$\textcircled{20} \quad F = \langle 2y, 3x, x+y \rangle \quad \vec{r}(t) = \left\langle \cos t, \sin t, \frac{t}{6} \right\rangle, \quad 0 \leq t \leq 2\pi.$$

Find the work done by F over the curve $\vec{r}(t)$.

$$W = \int_C F \cdot T \, ds$$

$$= \int_0^{2\pi} F \cdot \frac{\vec{v}(t)}{|\vec{v}(t)|} |\vec{v}(t)| \, dt$$

$$= \int_0^{2\pi} F \cdot \vec{v}(t) \, dt$$

$$= \int_0^{2\pi} \langle 2 \sin t, 3 \cos t, \cos t + \sin t \rangle \cdot \left\langle -\sin t, \cos t, \frac{1}{6} \right\rangle dt$$

$$= \int_0^{2\pi} \left(-2 \sin^2 t + 3 \cos^2 t + \frac{1}{6} \cos t + \frac{1}{6} \sin t \right) dt$$

$$= \int_0^{2\pi} \left(-2 \frac{1 - \cos 2t}{2} + 3 \frac{1 + \cos 2t}{2} + \frac{1}{6} \cos t + \frac{1}{6} \sin t \right) dt$$

$$= \int_0^{2\pi} \left(-1 + \cos 2t + \frac{3}{2} + \frac{3}{2} \cos 2t + \frac{1}{6} \cos t + \frac{1}{6} \sin t \right) dt$$

$$= \int_0^{2\pi} \left(\frac{1}{2} + \frac{5}{2} \cos 2t + \frac{1}{6} \cos t + \frac{1}{6} \sin t \right) dt$$

$$= \left[\frac{1}{2} t + \frac{5}{4} \sin 2t + \frac{1}{6} \sin t - \frac{1}{6} \cos t \right]_0^{2\pi}$$

$$= \left(\frac{1}{2} 2\pi + \frac{5}{4} \sin 4\pi + \frac{1}{6} \sin 2\pi - \frac{1}{6} \cos 2\pi \right) - \left(0 + \frac{5}{4} \sin 0 + \frac{1}{6} \sin 0 - \frac{1}{6} \cos 0 \right)$$

$$= \left(\pi + 0 + 0 - \frac{1}{6} \right) - \left(0 + 0 + 0 - \frac{1}{6} \right) = \boxed{\pi}$$

16.2

(24)

$$C_1 : \vec{r}(t) = \langle t, 0 \rangle, \quad 0 \leq t \leq 1$$

$$C_2 : \vec{r}(t) = \langle 1-t, t \rangle, \quad 0 \leq t \leq 1.$$

$$C_3 : \vec{r}(t) = \langle 0, 1-t \rangle, \quad 0 \leq t \leq 1$$

Evaluate $\int_C (x-y) dx + (x+y) dy$

Breaking up C into parts C_1, C_2, C_3 , the answer will be the sum of the following integrals:

$$\int_{C_1} (x-y) dx = \int_0^1 (t-0) \frac{dx}{dt} dt = \int_0^1 t dt = \left[\frac{t^2}{2} \right]_0^1 = \frac{1}{2}$$

$$\int_{C_1} (x+y) dy = \int_0^1 (t+0) \frac{dy}{dt} dt = \int_0^1 t \cdot 0 dt = 0$$

$$\int_{C_2} (x-y) dx = \int_0^1 (1-t-t) \frac{dx}{dt} dt = \int_0^1 (1-2t)(-1) dt = \int_0^1 (2t-1) dt = \left[t^2 - t \right]_0^1 = 0$$

$$\int_{C_2} (x+y) dy = \int_0^1 (1-t+t) \frac{dy}{dt} dt = \int_0^1 1 \cdot 1 dt = \int_0^1 dt = \left[t \right]_0^1 = 1$$

$$\int_{C_3} (x-y) dx = \int_0^1 (0 - (1-t)) \frac{dx}{dt} dt = \int_0^1 (t-1) \cdot 0 dt = 0$$

$$\int_{C_3} (x+y) dy = \int_0^1 (0 + (1-t)) \frac{dy}{dt} dt = \int_0^1 (1-t)(-1) dt = \int_0^1 (t-1) dt = \left[\frac{t^2}{2} - t \right]_0^1 = -\frac{1}{2}$$

From the above, $\int_C (x-y) dx + (x+y) dy =$

$$\frac{1}{2} + 0 + 0 + 1 + 0 - \frac{1}{2} = \boxed{1}$$

16.3 ⑥ Is $\vec{F}(x,y,z) = \langle e^x \cos y, -e^x \sin y, z \rangle$ conservative?

We apply the component test for conservative fields.

This involves the following computations:

$$\frac{\partial P}{\partial y} = \frac{\partial}{\partial y} [z] = 0 \quad \frac{\partial N}{\partial z} = \frac{\partial}{\partial z} [e^x \sin y] = 0$$

$$\frac{\partial M}{\partial z} = \frac{\partial}{\partial z} [e^x \cos y] = 0 \quad \frac{\partial P}{\partial x} = \frac{\partial}{\partial x} [z] = 0$$

$$\frac{\partial N}{\partial x} = \frac{\partial}{\partial x} [-e^x \sin y] = -e^x \sin y \quad \frac{\partial M}{\partial y} = \frac{\partial}{\partial y} [e^x \cos y] = -e^x \sin y$$

$$\text{Since } \frac{\partial P}{\partial y} = \frac{\partial N}{\partial z} \quad \frac{\partial M}{\partial z} = \frac{\partial P}{\partial x} \quad \text{and} \quad \frac{\partial N}{\partial x} = \frac{\partial M}{\partial y},$$

the answer is **YES** the field is conservative

⑩ Find a potential function for $\vec{F} = \langle y \sin z, x \sin z, xy \cos z \rangle$

We seek a function f with $\nabla f = \langle \underbrace{y \sin z}_{\frac{\partial f}{\partial x}}, \underbrace{x \sin z}_{\frac{\partial f}{\partial y}}, \underbrace{xy \cos z}_{\frac{\partial f}{\partial z}} \rangle$

$$\text{Since } \frac{\partial f}{\partial x} = y \sin z,$$

$$f(x,y,z) = \int y \sin z \, dx = xy \sin z + g(y,z)$$

$$\text{Then } \frac{\partial f}{\partial y} = x \sin z + \frac{\partial g}{\partial y} = x \sin z$$

$$\text{Thus } \frac{\partial g}{\partial y} = 0 \quad \text{so } g(y,z) = h(z) \text{ depends only on } z$$

$$\text{Thus } f(x,y,z) = xy \sin z + h(z)$$

$$\text{so } \frac{\partial f}{\partial z} = xy \cos z + \frac{\partial h}{\partial z} = xy \cos z$$

$$\text{Thus } \frac{\partial h}{\partial z} = 0 \quad \text{so } h(z) = C \text{ (constant)}$$

Consequently $f(x,y,z) = xy \sin z + C$ is a potential function.

16.3

(20) Evaluate this integral given that the associated field is conservative:

$$\int_{(1,2,1)}^{(2,1,1)} (2x \ln y - yz) dx + \left(\frac{x^2}{y} - xz\right) dy - xy dz$$

The answer will be $f(2,1,1) - f(1,2,1)$ where f satisfies

$$\nabla f = \langle 2x \ln y - yz, \frac{x^2}{y} - xz, -xy \rangle, \text{ or}$$

$$\text{(i)} \quad \frac{\partial f}{\partial x} = 2x \ln y - yz$$

$$\text{(ii)} \quad \frac{\partial f}{\partial y} = \frac{x^2}{y} - xz$$

$$\text{(iii)} \quad \frac{\partial f}{\partial z} = -xy$$

$$\text{From (iii)} \quad f(x,y,z) = \int -xy dz = -xyz + g(x,y) \quad (*)$$

Taking $\frac{\partial}{\partial y}$ of this and equating with (ii) yields

$$\frac{\partial}{\partial y} [f(x,y,z)] = -xz + \frac{\partial g}{\partial y} = \frac{x^2}{y} - xz$$

$$\text{Therefore } \frac{\partial g}{\partial y} = \frac{x^2}{y} \Rightarrow g(x,y) = \int \frac{x^2}{y} dy = x^2 \ln y + C \quad (**)$$

Now combining (*) and (**) we get

$$f(x,y,z) = x^2 \ln y - xyz + C$$

Let $C=0$, and we get a potential function $f(x,y,z) = x^2 \ln y - xyz$

Then

$$\int_{(1,2,1)}^{(2,1,1)} (2x \ln y - yz) dx + \left(\frac{x^2}{y} - xz\right) dy - xy dz$$

$$= f(2,1,1) - f(1,2,1) = (2^2 \ln 1 - 2 \cdot 1 \cdot 1) - (1^2 \ln 2 \cdot 1 - 1 \cdot 2 \cdot 1)$$

$$= (4 \cdot 0 - 2) - (\ln 2 - 2) = -\ln 2 = \boxed{\ln \frac{1}{2}}$$
